

Download Ccnp Self-study : Building Cisco Multilayer Switched Networks (bcmsn) (2nd Edition)

The CU bit is not used. Using DSCP values for classification of packets is the leading method for classification in all enterprise and service provider multilayer switched networks. This chapter describes how QoS is an integral part of any multilayer switched network deployment. With QoS, you can build a network of predictable behavior for latency, jitter, and packet loss. In addition, QoS mitigates anomalous network behavior and provides for differentiation of traffic flows. - Ccnp Self-study : Building Cisco Multilayer Switched Networks (bcmsn) (2nd Edition)
