Download Reflection Over X Axis Formula

Mod note: Emphasis added to highlight changes from original post. Hi, Thanks for your response. I would make some corrections: << Eq are provided for reflecting over x-axis, y-axis , over the line x=2 & over the line x=y but no equations are shown for rotating object over an oblique line.Definitions and terminology Dyadic, outer, and tensor products. A dyad is a tensor of order two and rank one, and is the result of the dyadic product of two vectors (complex vectors in general), whereas a dyadic is a general tensor of order two (which may be full rank or not).. There are several equivalent terms and notations for this product: the dyadic product of two vectors and is denoted ...The gamma function can be seen as a solution to the following interpolation problem: "Find a smooth curve that connects the points (x, y) given by y = (x ? 1)! at the positive integer values for x.". A plot of the first few factorials makes clear that such a curve can be drawn, but it would be preferable to have a formula that precisely describes the curve, in which the number of operations ...To shift the graph left k units, add k to the value of x.To shift the graph to the right k units, subtract k from x.Notice that to shift to the right requires subtraction from x. - Reflection Over X Axis Formula
